

True Impact Master Roster

Ultimate Frisbee Stats Tracker • Advanced Analytics Documentation

Overview: The True Impact Philosophy

The **True Impact Master Roster** represents a paradigm shift in sports analytics. Standard box scores (Goals and Assists) often reward the final action of a point while ignoring the strategic infrastructure that made it possible.

This system is designed to identify the **Engine** (the facilitators), the **Executioner** (the finishers), and the **Unsung Hero** (defensive specialists) by measuring possession value and lineup efficiency.

Core Statistics Glossary

Metric	Name	Definition
PTS PLAYED	Points Played	Split into O (Offensive) and D (Defensive) starts. The baseline for normalization.
TOUCHES/PT	Touches per Point	Total touches divided by points played. Measures involvement volume.
G/A/SA/D	Box Score	Goals, Assists, Secondary Assists, and Defences (Blocks).
TURNOVERS	Error Tracking	Detailed breakdown of Throwaways (T), Drops (D), and Stall-outs (S).
COMP %	Completion %	Percentage of passes completed. Measures individual reliability.
SYSTEM IMPACT	Efficiency Delta	How much the team success rate improves when this player is on the field.
OCE %	Offensive Conv.	Percentage of offensive possessions converted into scores while active.

METRIC	NAME	DEFINITION
OVA	Off. Value Add	Cumulative score rewarding the facilitators of clean offensive flow.
NIS	Net Impact Score	Weighted individual performance score (weighted +/-).

Advanced Metric Logic

1. System Impact % (Efficiency Delta)

This is a state-aware metric. It calculates team efficiency relative to the starting state of a point (starting on Offense vs. Defense). It removes the bias that favors O-line players by measuring performance vs. the team baseline for that specific state.

 **Break Impact:** Awarded to players on the field during "Breaks" (points won starting on defense).

2. OVA: Offensive Value Add

OVA identifies the **Pilots** of the offense. It rewards ball progression and secondary playmaking more heavily than the final catch.

$$\text{OVA} = (\text{Clean_Hold} \times 0.5) + (\text{Assist} \times 2.0) + (\text{Secondary_Assist} \times 1.5)$$

A "Clean Hold" is a goal scored starting on offense with zero team turnovers. This credits "Passengers" for maintaining a functional system while highlighting "Pilots" who drive the score.

3. OCE %: Offensive Conversion Efficiency

Measures the surgical nature of the offense. It answers: *"When this player is active, do we score cleanly or do we leak possessions?"*

- **Elite:** > 85%
- **Consistent:** 70% - 84%
- **Struggling:** < 50%

How to Read the Roster

The Engine (The Hub)

Characterized by high **Usage**, high **Secondary Assists**, and a dominant **OVA**. They may not score the most goals, but they dictate the rhythm. (Example: Rouven in the provided dataset).

The Executioner

High **NIS** and **Goals**. These players maximize efficiency but rely on the Engine to get the disc into the red zone. (Example: Jim).

The Unsung Hero

Minimal traditional stats but high **System Impact %**. These players are the glue of the team, often driving success through spacing and defensive pressure. (Example: Ru/Katja).
