UStats Pro

The Complete User Guide (v 2026-05-21)

Introduction

UStats Pro is a **web-based, cross-platform** application for tracking Ultimate Frisbee games. It runs on modern browsers (desktop, iOS, Android) and stores all data in **Supabase**, giving you automatic cloud sync and offline fallback.

Note: The *Voice Pro* feature (advanced voice-command interface) is **coming soon** – the current voice support is limited to basic start/undo commands.

1Getting Started

1.1 Open the App

1. Navigate to **https://ustats.pro** on any device.
2. Click **Login / Sign up** (top-right corner).
3. Choose an authentication method – email/password or Google/Apple.
4. Verify your email if you used the email method.

1.2 First-time Onboarding Wizard

Step	What you do
Create a Club	Enter a club name (e.g.,  <i>Rouvin Ultimate</i>).
	Optionally upload a logo. 
	Choose the club, give the team a name (e.g.,  <i>UStats Pro A</i>), and select a team colour for UI accents.
Add Players	You'll be taken to the Player Roster screen (see Section 3). 

Once the wizard finishes you land on the **Dashboard** for the newly created team.

2 Club & Team Management

2.1 Clubs

- **Create a new club** → Settings (gear icon) → *New Club*.
- **Edit club** → change name, logo, or delete the club (deleting a club also deletes all its teams).

2.2 Teams

- **Add a team** → Inside a club → *Add Team*.
- **Rename / Delete** → Hover over the team name in the sidebar to reveal edit/delete icons.
- **Cascade Delete** – deleting a team automatically removes:
 - Players linked to the team
 - All recorded stats and points
 - Managed line templates attached to the team

2.3 Admin Impersonation Lock (Glassmorphic Blocker)

When an admin logs in **without a shadow team**, the UI covers the main view with a semi-transparent glass effect and a message: “*You must select a shadow team to continue.*” This prevents accidental data changes.

3 Player Roster

3.1 Adding Players

1. Click **Players** in the left navigation.
2. Press **+ Add Player**.
3. Fill the form:
 - **Name** (required)
 - **Jersey Number** (optional)
 - **Position** (handler, cutter, etc.)
 - **Active** toggle – determines if the player can be selected for a lineup.
4. Click **Save**.

3.2 Editing / Deleting Players

- Hover a player row → **Edit** (pencil) or **Delete** (trash) icons appear.
- Deleting a player also removes them from any saved Managed Lines.

3.3 Bulk Actions

- Use the checkbox column to select multiple players.
 - Bulk **Toggle Active** → change all selected players to active/inactive.
 - Bulk **Delete** → remove several players at once (confirmation dialog appears).
-

4 Managed Lines (Line Templates)

Managed Lines are reusable line-ups you can save, edit, and reuse across games.

4.1 Opening the Managed Lines Modal

1. In **Lineup Selector**, click the **Manage Lines** button (bottom left, icon with three horizontal lines).
2. The modal slides in with a dark glass backdrop.

4.2 Creating a New Line

1. In the **Left Column**, click the **+** button.
2. Enter a **Line Name** (e.g., *Starting 7*). Press **Enter** or click the **+** icon.
3. The line appears in the list with a badge showing the number of players selected (initially 0).
4. Click the line name to move to the **Right Column**.
5. In the right column, you see a list of all team players with a **checkbox**-style button.
 - Click a player to **toggle selection** – the button turns indigo when selected.
 - Selected players show a **check-mark** icon.
6. When you're satisfied, the badge updates automatically.

4.3 Editing an Existing Line

- Click any line in the left column → the right column loads its player selection.
- Add or remove players as described above. Changes are saved instantly.

4.4 Deleting a Line

- Click the **trash** icon next to the line name (or open the line and press the **Delete Line** button at the top of the modal).
- Confirm the deletion in the browser dialog.

4.5 Syncing Managed Lines Across Devices

1. **On Load** – the app reads localStorage (lines_<teamId>) for instant UI rendering.
2. If online, it calls fetchManagedLines(teamId) (Supabase teams.managed_lines column) and replaces the local list with the cloud version.
3. **Saving** – every time you add/edit/delete a line, the UI calls saveManagedLines(teamId, newLines). The function updates the cloud column **asynchronously**, while the local copy is updated instantly.
4. **Offline Fallback** – if you lose connectivity, changes stay in localStorage. When the device regains a connection, the next mount will push pending changes automatically.

Important: The first time you use Managed Lines, the app will attempt to create the managed_lines column automatically via the migration script you ran in Supabase. If you see a warning, run:

```
ALTER TABLE public.teams ADD COLUMN IF NOT EXISTS managed_lines JSONB
DEFAULT '[]'::jsonb;
```

5 Selecting a Line & Starting a Point

5.1 Choosing a Line

1. Open **Lineup Selector** (main screen after selecting a team).
2. Click a line from the **Lines** list on the left. The UI highlights the active line.
3. The player list on the right updates to show which players are selected.

5.2 Validation Rules

- **Grass (7-player) games:** Expected count = 7.
- **Beach / Indoor (5-player) games:** Expected count = 5.
- **Training / Drill:** No specific count required.

If the selected line does **not** match the expected count, a **modal** appears:

You selected X players, but a <game-type> game usually expects Y. **Start point** anyway?

You can press **OK** to proceed or **Cancel** to adjust the line.

Note: We removed the previous auto-start feature. After confirming the line, you **must** press the “**Start Point**” button manually.

5.3 Starting a Point

1. Ensure **Match Name** (field at top) is filled.
2. For a non-training game, fill **Opponent Name** and set **Starting Possession** (O/D).
3. Press **Start Point**.
4. The app:
 - Clears any previously active lineup in Supabase (clearActiveLineup).
 - Records the new lineup (recordLineup).
 - Emits **audio** and, if enabled, **haptic** feedback.
 - Increments the point counter.

6 Audio & Haptic Feedback

Setting	Description
Audio	Plays a short click sound at point start. Toggle in Settings → Audio Feedback .
Haptic	Triggers a 30 ms vibration on devices that support it (Android phones, iOS devices with Vibration API). Enable via Settings → Haptic Feedback .

If you experience **no vibration on iOS**, go to **Settings** → **Safari** → **Advanced** → **Allow Web App Vibration**.

7 Voice Commands (Current) & Voice Pro (Coming Soon)

7.1 Current Voice Support

- **Start Point** – say “Start point”.
- **Undo Point** – say “Undo point”.

- Voice must be enabled in **Settings → Voice Commands**. The microphone icon appears in the top-right toolbar.

7.2 Voice Pro (Coming Soon)

- Full-sentence natural language (e.g., *“Record a pull for player 12 and start the next point.”*)
 - Automatic transcription with AI-powered intent detection.
 - Multi-language support.
 - Scheduled release: **Q4 2026**.
-

8 Pull Tracker & Stats

- The **Pull Tracker** bar at the top shows:
 - Current point number.
 - Half-time indicator (green when a half-time has been logged).
 - A **Reset** button to clear the current point (available only to admins).
 - All stat entries (pulls, blocks, goals, turnovers, etc.) are stored in Supabase stats table.
 - If offline, entries are queued in IndexedDB and synced when back online.
-

9 Coach Dashboard

9.1 Active-Player Count Button

- Shows **green** when the active lineup meets the expected player count for the selected game type.
- Hover tooltip: *“7 players selected – ready to start point.”*
- Clicking the button opens a **quick-view** of the selected players.

9.2 Export PDF Report

1. In the dashboard, click **Export PDF** (top-right).
 2. Choose a filename and press **Download**.
 3. The PDF contains:
 - Team & match metadata
 - Full point-by-point lineup list
 - All recorded stats in a table format
 - A summary page with totals per player.
-

Settings & Preferences

Setting	Location	Options
Audio Feedback	Settings → Audio	On / Off
Haptic Feedback	Settings → Haptic	On / Off
Voice Commands	Settings → Voice	On / Off (current)
Sync on Wi-Fi only	Settings → Sync	Wi-Fi only / All networks
Theme	Settings → Appearance	Light / Dark (auto)

Language Settings → Language English (default) – other languages planned

All settings are stored in **Supabase user profile** and synced across devices.

Advanced Operations

Export / Import

- **Export JSON** → Settings → *Export Data* → download a .json file containing the entire team (players, lines, stats).
- **Import JSON** → Settings → *Import Data* → select a previously exported file.
- The import process validates schema compatibility and merges data, preserving existing IDs.

Multiple Clubs / Teams

- Use the **Club selector** dropdown at the top-left to switch between clubs.
 - Each club can have multiple teams; the UI updates instantly.
-

Troubleshooting & FAQ

Issue	Solution
Managed lines not syncing	Ensure you are online. The app will fallback to local storage. Verify the managed_lines column exists in Supabase (SELECT * FROM teams LIMIT 1).
Zero-players selected warning	This warning appears when you select a managed line that has 0 players saved. Edit the line in the Manage Lines modal and add players.
Audio/haptic not playing on iOS	iOS requires user interaction before enabling audio. Tap anywhere on the screen first, then enable the setting.
Undo does not revert the lineup	The Undo button restores the previous point's lineup from IndexedDB. If you cleared the browser cache, the undo history is lost.
Voice commands not recognized	Make sure microphone permission is granted. Speak clearly and pause briefly after each command.
Database migration required	Run the following SQL in Supabase:

```
ALTER TABLE public.teams ADD COLUMN IF NOT EXISTS managed_lines JSONB DEFAULT '[]'::jsonb;
```
```

I **\*\*App shows a glass blocker after login\*\*** I You **are** logged **in as** an admin **without** a shadow team.  
Choose a shadow team **in** the admin panel **or** ask an owner **to** assign one. I
